

Email Submission: Nina & Brian Earl

We consider technical/laboratory genetic modification of organisms a dangerous experiment that interferes with natural processes when the biological outcomes are largely unknown.

Advances in plants, animals and fibre production has historically been achieved through selection processes without GM. The introduction of GM organisms is driven by profit and technological advance for the sake of it rather than need for the common good.

We are not purists and accept some advances are necessary and beneficial but draw the line at GM. As best we can, we consume GM free foods and avoid GM products. We do not want GM organisms entering the food chain and the environment, humans have interfered with nature enough without this.
